

Cloud Support Ticketing Simulation

This document demonstrates a simulated Cloud Support Engineer ticketing workflow based on real AWS projects. The focus is on incident triage, troubleshooting, root cause analysis, resolution, and preventive actions—independent of any specific ticketing tool.

Project Objectives

- Demonstrate real-world cloud incident handling
- Show structured troubleshooting and documentation skills
- Simulate ticket-based workflows used by Cloud Support teams

Ticket Workflow

- Incident reported by user or monitoring system
- Initial triage and prioritization
- Technical investigation and root cause analysis
- Resolution and verification
- Preventive actions and documentation

Sample Tickets Included

- CS-001: EC2 Connectivity Issue (EC2, VPC)
- CS-002: CloudFront Failover Behavior (CloudFront)
- CS-003: CI/CD Deployment Failure (CodePipeline, CodeBuild)

Skills Demonstrated

- Cloud troubleshooting and incident response
- AWS networking and compute debugging
- CI/CD pipeline investigation
- Clear technical documentation

This project reflects the responsibilities of an entry-level Cloud Support Engineer and complements hands-on cloud architecture and DevOps projects within the portfolio.
