Connect a Web App to Amazon Aurora

Sample page

ID	NAME	ADDRESS
1	Mr Eddy Example	100 Example Street, NY
2	Miss Sarah Silver	02 Moonlight Lane, San Diego

Introducing Today's Project!

What is Amazon Aurora?

Amazon Aurora is a cloud-based relational database service that works like MySQL or PostgreSQL but is faster and automatically managed by AWS. It is useful because it removes the need to manage servers yourself, keeps your data backed up, scales with your application, and stays highly available even if part of the system fails.

How I used Amazon Aurora in this project

In today's project, I used Amazon Aurora to create a database and connect to a webapp.

One thing I didn't expect in this project was...

One thing I didn't expect in this project was encountering so many errors and setbacks for the SamplePage.php script.

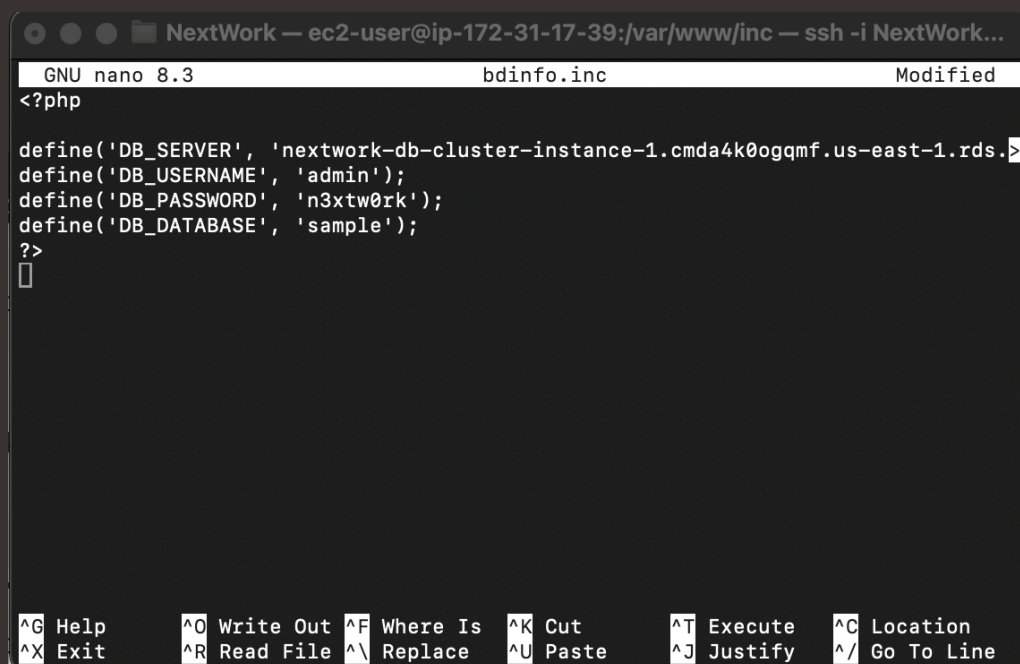

This project took me...

This project took me 3 hours.

Connecting my Web App to Aurora

I set up my EC2 instance's connection details to my database by navigating to `/var/www/inc/` and creating a `bdinfo.inc` PHP configuration file. Inside it, I defined constants for the Aurora database endpoint, username, password, and database name. This file allows my web application to retrieve the correct connection parameters when communicating with the RDS/Aurora cluster.

```
NextWork — ec2-user@ip-172-31-17-39:/var/www/inc — ssh -i NextWork...
GNU nano 8.3      bdinfo.inc      Modified
<?php

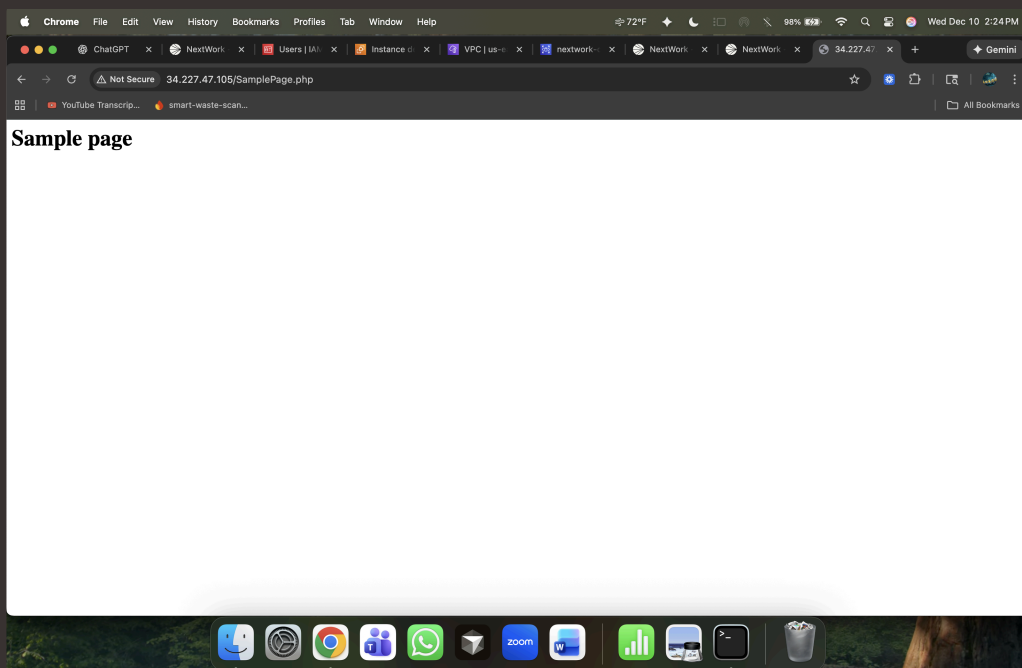

define('DB_SERVER', 'nextwork-db-cluster-instance-1.cmda4k0ogqmf.us-east-1.rds.>
define('DB_USERNAME', 'admin');
define('DB_PASSWORD', 'n3xtw0rk');
define('DB_DATABASE', 'sample');
?>
[]

^G Help      ^O Write Out ^F Where Is  ^K Cut       ^T Execute   ^C Location
^X Exit      ^R Read File ^\ Replace   ^U Paste     ^J Justify   ^/ Go To Line
```

My Web App Upgrade

Next, I upgraded my web app by adding a php script.

Testing my Web App

To make sure my web app was working correctly, I connected to the database using the MySQL CLI and verified that the sample database and its tables existed and that I could successfully run SELECT queries to view the data.

```
MySQL [sample]> SELECT * FROM EMPLOYEES;
```

ID	NAME	ADDRESS
1	Mr Eddy Example	100 Example Street, New York
2	Miss Sarah	02 Silver Lane, San Francisco

```
2 rows in set (0.001 sec)
```
